

## TEST REPORT

### SPECIFIC ABSORPTION RATE (SAR) EVALUATION REPORT

For DECT Babyphone - Parent Unit

Model Number: SCD730-H

Brand Name: Philips

FCC ID: 2AEFK-SCD730H

Prepared for  
Philips Consumer Lifestyle  
High Tech Campus Building HTC 37- parterre  
Eindhoven 5656 AE Netherlands

## TEST REPORT

### 1. TEST RESULT SUMMARY

|                                  |  |
|----------------------------------|--|
| <b>Applicant:</b>                | Philips Consumer Lifestyle   |
| <b>Applicant Address:</b>        | High Tech Campus Building HTC 37- parterre<br>Eindhoven 5656 AE Netherlands  |
| <b>Model:</b>                    | SCD730-H   |
| <b>Brand Name:</b>               | Philips  |
| <b>Serial Number:</b>            | N/A  |
| <b>FCC ID:</b>                   | 2AEFK-SCD730H  |
| <b>Test Device:</b>              | Production Unit  |
| <b>Exposure Category:</b>        | General Population/Uncontrolled Exposure   |
| <b>Date of Test:</b>             | August 10, 2018  |
| <b>Place of Testing:</b>         | Shenzhen UnionTrust Quality and Technology Co., Ltd.<br>16/F, Block A, Building 6, Baoneng Science and Technology<br>Park, Qingxiang Road No.1, Longhua New District, Shenzhen,<br>China |
| <b>Environmental Conditions:</b> | Temperature: +18 to 25°C<br>Humidity 25 to 75%   |
| <b>Test Specification:</b>       | ANSI/IEEE C95.1<br>IEEE Std 1528: 2013<br>FCC KDB Publication 447498 D01 v06<br>FCC KDB Publication 865664 D01 v01r04<br>FCC KDB Publication 865664 D02 v01r02                           |

The maximum spatial peak SAR value for the sample device averaged over 1g was found to be:

| Band        | Operating Mode | TX Frequency (MHz)  | Highest Reported SAR |              |
|-------------|----------------|---------------------|----------------------|--------------|
|             |                |                     | 1 g Head             | 1g Body-Worn |
| 1.9GHz DECT | Voice          | 1921.536 – 1928.448 | 0.008 W/kg           | 0.035 W/kg   |

This wireless portable device has been shown to be capable of compliance for localized specific absorption rate (SAR) for uncontrolled environment / general population exposure limits specified in ANSI/IEEE C95.1.

## TEST REPORT

### 2. GENERAL INFORMATION

#### 2.1. Description of Equipment under test (EUT)

| <b>S/W Version:</b>                       | N/A  |
| <b>Battery Type:</b>                      | 2.4VDC (1x2.4V 1300mAh Ni-MH rechargeable battery pack)<br>Model: PHILIPS PHRHC152M000   |
| <b>Body-worn Accessories:</b>             | Belt Clip  |

**\*Note:**

1. DECT has a TDD/TDMA frame structure with a complete frame of 10ms duration with 24 time slots. And under these 24 time slots, the first 12 slots are allocated for the transmission from base station to handsets, and the other 12 slots are for the transmission from handsets to base station. During a call, the handset of this product will use one of 24 time slots to transmit under worst case, which gives a duty cycle of 1/24 ( = 4.2%).

## TEST REPORT

### 2.2. EUT Antenna Locations

Details of antenna specification are shown in separate antenna dimension document.

## TEST REPORT

### 2.3. Nominal and Maximum Output Power Specifications

The EUT operates using the following maximum and nominal output power specifications. SAR values were scaled to the maximum allowed power to determine compliance per KDB Publication 447498.

| Band        | Operating Mode | TX Frequency (MHz)  | Output Power  |               |
|-------------|----------------|---------------------|---------------|---------------|
|             |                |                     | Nominal (dBm) | Maximum (dBm) |
| 1.9GHz DECT | Voice          | 1921.536 – 1928.448 | +18.8         | +20.4         |

## TEST REPORT

### 3. SAR MEASUREMENT SYSTEM DESCRIPTION

SAR is related to the rate at which energy is absorbed per unit mass in object exposed to a radio field. The SAR distribution in a biological body is complicated and is usually carried out by experimental techniques or numerical modeling. The standard recommends limits for two tiers of groups, occupational/controlled and occupational/uncontrolled, based on a person's awareness and ability to exercise control over his or her exposure. In general, occupational/controlled exposure limits are higher than the limits for general population/uncontrolled.

The SAR definition is the time derivative (rate) of the incremental energy (dW) absorbed by (dissipated in) an incremental mass (dm) contained in a volume element (dv) of given mass density ( $\rho$ ). The equation description is as below:

$$SAR = \frac{d}{dt} \left( \frac{dW}{dm} \right) = \frac{d}{dt} \left( \frac{dW}{\rho dV} \right)$$

SAR is expressed in units of Watts per kilogram (W/Kg)

SAR can be obtained using either of the following equations:

$$SAR = \frac{\sigma E^2}{\rho}$$

$$SAR = c_h \left. \frac{dT}{dt} \right|_{t=0}$$

Where

- SAR is the specific absorption rate in watts per kilogram;
- E is the r.m.s. value of the electric field strength in the tissue in volts per meter;
- $\sigma$  is the conductivity of the tissue in siemens per metre;
- $\rho$  is the density of the tissue in kilograms per cubic metre;
- $c_h$  is the heat capacity of the tissue in joules per kilogram and Kelvin;

$\left. \frac{dT}{dt} \right|_{t=0}$  is the initial time derivative of temperature in the tissue in kelvins per second

## TEST REPORT

### SPEAG DASY System

DASY system consists of high precision robot, probe alignment sensor, phantom, robot controller, controlled measurement server and near-field probe. The robot includes six axes that can move to the precision position of the DASY5 software defined. The DASY software can define the area that is detected by the probe. The robot is connected to controlled box. Controlled measurement server is connected to the controlled robot box. The DAE includes amplifier, signal multiplexing, AD converter, offset measurement and surface detection. It is connected to the Electro-optical coupler (ECO). The ECO performs the conversion from the optical into digital electric signal of the DAE and transfers data to the PC.

DASY Measurement System

## TEST REPORT

### ROBOT

The DASY system uses the high precision robots from Stäubli SA (France). For the 6-axis controller system, the robot controller version (DASY5: CS8c) from Stäubli is used. The Stäubli robot series have many features that are important for our application:

- High precision (repeatability  $\pm 0.035$  mm)
- High reliability (industrial design)
- Jerk-free straight movements
- Low ELF interference (the closed metallic construction shields against motor control fields)

## TEST REPORT

### PROBE

The SAR measurement is conducted with the dosimetric probe. The probe is specially designed and calibrated for use in liquid with high permittivity. The dosimetric probe has special calibration in liquid at different frequency.

|                      |  |
|----------------------|--|
| <b>Model</b>         | EX3DV4   |
| <b>Construction</b>  | Symmetrical design with triangular core. Built-in shielding against static charges. PEEK enclosure material (resistant to organic solvents, e.g., DGBE). |
| <b>Frequency</b>     | 10 MHz to 6 GHz<br>Linearity: $\pm 0.2$ dB   |
| <b>Directivity</b>   | $\pm 0.3$ dB in HSL (rotation around probe axis)<br>$\pm 0.5$ dB in tissue material (rotation normal to probe axis)                                      |
| <b>Dynamic Range</b> | 10 $\mu$ W/g to 100 mW/g<br>Linearity: $\pm 0.2$ dB (noise: typically $< 1$ $\mu$ W/g)   |
| <b>Dimensions</b>    | Overall length: 337 mm (Tip: 20 mm)<br>Tip diameter: 2.5 mm (Body: 12 mm)<br>Typical distance from probe tip to dipole centers: 1 mm                     |

|                      |   |
|----------------------|---|
| <b>Model</b>         | ES3DV3  |
| <b>Construction</b>  | Symmetrical design with triangular core. Interleaved sensors. Built-in shielding against static charges. PEEK enclosure material (resistant to organic solvents, e.g., DGBE). |
| <b>Frequency</b>     | 10 MHz to 4 GHz<br>Linearity: $\pm 0.2$ dB  |

| <b>Dynamic Range</b> | 5 $\mu$ W/g to 100 mW/g<br>Linearity: $\pm 0.2$ dB  |
| <b>Dimensions</b>    | Overall length: 337 mm (Tip: 20 mm)<br>Tip diameter: 3.9 mm (Body: 12 mm)<br>Distance from probe tip to dipole centers: 2.0 mm  |

## TEST REPORT

### DATA ACQUISITION ELECTRONICS (DAE)

|                             |   |
|-----------------------------|---|
| <b>Model</b>                | DAE3, DAE4  |
| <b>Construction</b>         | Signal amplifier, multiplexer, A/D converter and control logic. Serial optical link for communication with DASY embedded system (fully remote controlled). Two step probe touch detector for mechanical surface detection and emergency robot stop. |
| <b>Measurement Range</b>    | -100 to +300 mV (16 bit resolution and two range settings: 4mV, 400mV)  |
| <b>Input Offset Voltage</b> | < 5 $\mu$ V (with auto zero)  |
| <b>Input Bias Current</b>   | < 50 fA   |
| <b>Dimensions</b>           | 60 x 60 x 68 mm   |

## TEST REPORT

### PHANTOM

|                        |   |
|------------------------|---|
| <b>Model</b>           | Twin SAM  |
| <b>Construction</b>    | The shell corresponds to the specifications of the Specific Anthropomorphic Mannequin (SAM) phantom defined in IEEE 1528 and IEC 62209-1. It enables the dosimetric evaluation of left and right hand phone usage as well as body mounted usage at the flat phantom region. A cover prevents evaporation of the liquid. Reference markings on the phantom allow the complete setup of all predefined phantom positions and measurement grids by teaching three points with the robot. |
| <b>Material</b>        | Vinylester, glass fiber reinforced (VE-GF)  |
| <b>Shell Thickness</b> | 2 ± 0.2 mm (6 ± 0.2 mm at ear point)  |
| <b>Dimensions</b>      | Length: 1000 mm<br>Width: 500 mm<br>Height: adjustable feet   |
| <b>Filling Volume</b>  | approx. 25 liters   |

|                        |   |
|------------------------|---|
| <b>Model</b>           | ELI   |
| <b>Construction</b>    | Phantom for compliance testing of handheld and body-mounted wireless devices in the frequency range of 30 MHz to 6 GHz. ELI is fully compatible with the IEC 62209-2 standard and all known tissue simulating liquids. ELI has been optimized regarding its performance and can be integrated into our standard phantom tables. A cover prevents evaporation of the liquid. Reference markings on the phantom allow installation of the complete setup, including all predefined phantom positions and measurement grids, by teaching three points. The phantom is compatible with all SPEAG dosimetric probes and dipoles. |
| <b>Material</b>        | Vinylester, glass fiber reinforced (VE-GF)  |
| <b>Shell Thickness</b> | 2.0 ± 0.2 mm (bottom plate)   |
| <b>Dimensions</b>      | Major axis: 600 mm<br>Minor axis: 400 mm  |
| <b>Filling Volume</b>  | approx. 30 liters   |

## TEST REPORT

### DEVICE HOLDER

|                     |   |
|---------------------|---|
| <b>Model</b>        | Mounting Device<br>In combination with the Twin SAM Phantom or ELI4, the Mounting Device enables the rotation of the mounted transmitter device in spherical coordinates. Rotation point is the ear opening point.            |
| <b>Construction</b> | Transmitter devices can be easily and accurately positioned according to IEC, IEEE, FCC or other specifications. The device holder can be locked for positioning at different phantom sections (left head, right head, flat). |
| <b>Material</b>     | POM   |

|                     |  |
|---------------------|--|
| <b>Model</b>        | Laptop Extensions Kit<br>Simple but effective and easy-to-use extension for Mounting Device that facilitates the testing of larger devices according to IEC 62209-2 (e.g., laptops, cameras, etc.). It is lightweight and fits easily on the upper part of the Mounting Device in place of the phone positioner. |
| <b>Construction</b> |  |
| <b>Material</b>     | POM, Acrylic glass, Foam   |

### SYSTEM VALIDATION DIPOLES

|                         |  |
|-------------------------|--|
| <b>Model</b>            | D-Serial<br>Symmetrical dipole with 1/4 balun. Enables measurement of feed point impedance with NWA. Matched for use near flat phantoms filled with tissue simulating solutions. |
| <b>Construction</b>     |  |
| <b>Frequency</b>        | 750 MHz to 5800 MHz  |
| <b>Return Loss</b>      | > 20 dB  |
| <b>Power Capability</b> | > 100 W (f < 1GHz), > 40 W (f > 1GHz)  |

## TEST REPORT

During measurement, the system first does an area (2D) scan at a fixed depth within the liquid from the inside wall of the phantom scanning area is greater than the projection of EUT and antenna.

Area Scan Parameters extracted from KDB 865664

|  | $\leq 3$ GHz   | $> 3$ GHz   |
|--|--|---|
| Maximum distance from closest measurement point (geometric center of probe sensors) to phantom surface | 5 mm $\pm$ 1 mm  | $\frac{1}{2} \cdot \delta \cdot \ln(2)$ mm $\pm$ 0.5 mm |
| Maximum probe angle from probe axis to phantom surface normal at the measurement location              | 30° $\pm$ 1°   | 20° $\pm$ 1°  |
| Maximum area scan spatial resolution: $\Delta x_{Area}$ , $\Delta y_{Area}$                            | $\leq 2$ GHz: $\leq 15$ mm<br>2 – 3 GHz: $\leq 12$ mm  | 3 – 4 GHz: $\leq 12$ mm<br>4 – 6 GHz: $\leq 10$ mm      |
|  | When the x or y dimension of the test device, in the measurement plane orientation, is smaller than the above, the measurement resolution must be $\leq$ the corresponding x or y dimension of the test device with at least one measurement point on the test device. |   |

When the maximum SAR point has been found, the system will then carry out a zoom (3D) scan centered at that point to determine volume averaged SAR level.

Zoom Scan Parameters extracted from KDB 865664

|   |                                    |  |  |   |
|---|------------------------------------|--|--|---|
| Maximum zoom scan spatial resolution: $\Delta x_{Zoom}$ , $\Delta y_{Zoom}$   |                                    |  | $\leq 2$ GHz: $\leq 8$ mm<br>2 – 3 GHz: $\leq 5$ mm* | 3 – 4 GHz: $\leq 5$ mm*<br>4 – 6 GHz: $\leq 4$ mm*                            |
| Maximum zoom scan spatial resolution, normal to phantom surface   | uniform grid: $\Delta z_{Zoom}(n)$ |  | $\leq 5$ mm  | 3 – 4 GHz: $\leq 4$ mm<br>4 – 5 GHz: $\leq 3$ mm<br>5 – 6 GHz: $\leq 2$ mm    |
|   | graded grid                        | $\Delta z_{Zoom}(1)$ : between 1 <sup>st</sup> two points closest to phantom surface | $\leq 4$ mm  | 3 – 4 GHz: $\leq 3$ mm<br>4 – 5 GHz: $\leq 2.5$ mm<br>5 – 6 GHz: $\leq 2$ mm  |
|   |                                    | $\Delta z_{Zoom}(n>1)$ : between subsequent points                                   | $\leq 1.5 \cdot \Delta z_{Zoom}(n-1)$ mm             |   |
| Minimum zoom scan volume  | x, y, z                            |  | $\geq 30$ mm   | 3 – 4 GHz: $\geq 28$ mm<br>4 – 5 GHz: $\geq 25$ mm<br>5 – 6 GHz: $\geq 22$ mm |
| Note: $\delta$ is the penetration depth of a plane-wave at normal incidence to the tissue medium; see IEEE Std 1528-2013 for details.   |                                    |  |  |   |
| * When zoom scan is required and the <u>reported</u> SAR from the <u>area scan based 1-g SAR estimation</u> procedures of KDB Publication 447498 is $\leq 1.4$ W/kg, $\leq 8$ mm, $\leq 7$ mm and $\leq 5$ mm zoom scan resolution may be applied, respectively, for 2 GHz to 3 GHz, 3 GHz to 4 GHz and 4 GHz to 6 GHz. |                                    |  |  |   |

## TEST REPORT

### 4. TISSUE VERIFICATION

For SAR measurement of field distribution inside phantom, homogeneous tissue simulating liquid as below liquid recipes were filled to a depth of 15cm  $\pm$  0.5cm for below 3GHz measurement and of 10cm  $\pm$  0.5cm for above 3GHz.

#### HEAD TISSUE RECIPES

| Frequency | De-ionized Water | Salt | Ingredients     |       |       |             |
|-----------|------------------|------|-----------------|-------|-------|-------------|
|           |                  |      | 1,2 propanediol | DGBE  | DGMH  | Triton X100 |
| 450 MHz   | 33.5%            | 3.4% | 63.1%           |       |       |             |

| 2450 MHz  | 70.8%            | 0.3% |                 | 8.7% |       | 20.2%       |
| 5000 MHz  | 77.8%            |      |                 |      | 11.7% | 11.5%       |

## TEST REPORT

The head tissue dielectric parameters recommended by the IEEE Std 1528 have been incorporated in the following table. These head parameters are derived from planar layer models simulating the highest expected SAR for the dielectric properties and tissue thickness variations in a human head. For other head and body tissue parameters, they are recommended by KDB 865664.

| Target Frequency<br>(MHz) | head         |                | body         |                |
|---------------------------|--------------|----------------|--------------|----------------|
|                           | $\epsilon_r$ | $\sigma$ (S/m) | $\epsilon_r$ | $\sigma$ (S/m) |
| 300                       | 45.3         | 0.87           | 58.2         | 0.92           |
| 450                       | 43.5         | 0.87           | 56.7         | 0.94           |
| 835                       | 41.5         | 0.90           | 55.2         | 0.97           |
| 900                       | 41.5         | 0.97           | 55.0         | 1.05           |
| 915                       | 41.5         | 1.01           | 55.0         | 1.06           |
| 1450                      | 40.5         | 1.20           | 54.0         | 1.30           |
| 1610                      | 40.3         | 1.29           | 53.8         | 1.40           |
| 1800 – 2000               | 40.0         | 1.40           | 53.3         | 1.52           |
| 2450                      | 39.2         | 1.80           | 52.7         | 1.95           |
| 3000                      | 38.5         | 2.40           | 52.0         | 2.73           |
| 5800                      | 35.3         | 5.27           | 48.2         | 6.00           |

( $\epsilon_r$  = relative permittivity,  $\sigma$  = conductivity and  $\rho = 1000 \text{ kg/m}^3$ )

When a transmission band overlaps with one of the target frequencies, the tissue dielectric parameters of the tissue medium at the middle of a device transmission band should be within  $\pm 5\%$  of the parameters specified at that target frequency.

## TEST REPORT

The dielectric parameters of the liquids were verified prior to the SAR evaluation using SPEAG DAK-3.5 Dielectric Assessment Kit and Agilent Network Analyzer 8753ES.

The dielectric parameters were:

## TEST REPORT

### 5. SAR MEASUREMENT SYSTEM VERIFICATION

Each DASY5 system is equipped with one or more system check kits. These units, together with the predefined measurement procedures within the DASY5 software, enable user to conduct the system check. System kit includes a dipole, and dipole device holder.

The system check verifies that the system operates within its specifications. It's performed daily or before every SAR measurement. The system check uses normal SAR measurement in the flat section of the phantom with a matched dipole at a specified distance. The system check setup is shown as below.

## TEST REPORT

### VALIDATION DIPOLE

The dipoles used is based on the IEEE Std 1528, and is complied with mechanical and electrical specifications in line with the requirements of both FCC and KDB requirement.

### SYSTEM CHECK RESULTS

| Date         | Freq. (MHz) | Liquid Type | System Diople | Serial No. | System Verification             |                                   |                                     |                  |

## TEST REPORT

### 6. SAR EVALUATION

#### 6.1. Device test positions relative to the head

This practice specifies two handset test positions against the head phantom—the “cheek” position and the “tilt” position. These two test positions are defined in the following subclauses. The handset should be tested in both positions on left and right sides of the SAM phantom. If handset construction is such that the handset positioning procedures described below to represent normal use conditions cannot be used, e.g., some asymmetric handsets, alternative alignment procedures should be adapted with all details provided in the test report. These alternative procedures should replicate intended use conditions as closely as possible according to the intent of the procedures described in this subclause.

## TEST REPORT

### DEFINITION OF THE CHEEK POSITION

The cheek position is established as follows:

1. Ready the handset for talk operation, if necessary. For example, for handsets with a cover piece (flip cover), open the cover. If the handset can transmit with the cover closed, both configurations must be tested.
2. Define two imaginary lines on the handset—the vertical centerline and the horizontal line. The vertical centerline passes through two points on the front side of the handset—the midpoint of the width  $w_t$  of the handset at the level of the acoustic output (point A in below figure), and the midpoint of the width  $w_b$  of the bottom of the handset (point B). The horizontal line is perpendicular to the vertical centerline and passes through the center of the acoustic output (see below left figure). The two lines intersect at point A. Note that for many handsets, point A coincides with the center of the acoustic output; however, the acoustic output may be located elsewhere on the horizontal line. Also note that the vertical centerline is not necessarily parallel to the front face of the handset (see right figure), especially for clamshell handsets, handsets with flip covers, and other irregularly-shaped handsets.
3. Position the handset close to the surface of the phantom such that point A is on the (virtual) extension of the line passing through points RE and LE on the phantom (see the figure as next page), such that the plane defined by the vertical centerline and the horizontal line of the handset is approximately parallel to the sagittal plane of the phantom.
4. Translate the handset towards the phantom along the line passing through RE and LE until handset point A touches the pinna at the ERP.

## TEST REPORT

5. While maintaining the handset in this plane, rotate it around the LE-RE line until the vertical centerline is in the plane normal to the plane containing B-M and N-F lines, i.e., the Reference Plane.
6. Rotate the handset around the vertical centerline until the handset (horizontal line) is parallel to the N-F line.
7. While maintaining the vertical centerline in the Reference Plane, keeping point A on the line passing through RE and LE, and maintaining the handset contact with the pinna, rotate the handset about the N-F line until any point on the handset is in contact with a phantom point below the pinna on the cheek.

## TEST REPORT

### DEFINITION OF THE TILT POSITION

The tilt position is established as follows:

1. Repeat steps to place the device in the cheek position.
2. While maintaining the orientation of the handset, move the handset away from the pinna along the line passing through RE and LE far enough to allow a rotation of the handset away from the cheek by  $15^\circ$ .
3. Rotate the handset around the horizontal line by  $15^\circ$ .
4. While maintaining the orientation of the handset, move the handset towards the phantom on the line passing through RE and LE until any part of the handset touches the ear. The tilt position is obtained when the contact point is on the pinna. See the figure as below. If contact occurs at any location other than the pinna, e.g., the antenna at the back of the phantom head, the angle of the handset should be reduced.
5. In this case, the tilt position is obtained if any point on the handset is in contact with the pinna and a second point on the handset is in contact with the phantom, e.g., the antenna with the back of the head.

## TEST REPORT

### 6.2. Device test positions relative to body-worn accessory

Body-worn operating configurations are tested with the belt-clips and holsters attached to the device and positioned against a flat phantom in a normal use configuration. Per FCC KDB Publication 648474, Body-worn accessory exposure is typically related to voice mode operations when handsets are carried in body worn accessories. The body-worn accessory procedures in FCC KDB Publication 447498 should be used to test for body-worn accessory SAR compliance, without a headset connected to it. This enables the test results for such configuration to be compatible with that required for hotspot mode when the body-worn accessory test separation distance is greater than or equal to that required for hotspot mode, when applicable. When the reported SAR for a body-worn accessory, measured without a headset connected to the handset, is  $>1.2\text{W/kg}$ , the highest reported SAR configuration for that wireless mode and frequency band should be reported for that body-worn accessory with a headset attached to the handset.

SAR evaluation is required for body-worn accessories supplied with the host device. The test configurations must be conservative for supporting the body-worn accessory use conditions expected by users. Body-worn accessories that do not contain metallic or conductive components may be tested according to worst-case exposure configurations, typically according to the smallest test separation distance required for the group of body-worn accessories with similar operating and exposure characteristics. All body-worn accessories containing metallic components, either supplied with the product or available as an option from the device manufacturer, must be tested in conjunction with the host device to demonstrate compliance

Body-worn accessories may not always be supplied or available as options for some devices intended to be authorized for body-worn use. In this case, a test configuration with a separation distance between the back of the device and the flat phantom is used. Test position spacing was documented. Transmitters that are designed to operate in front of a person's face, as in push-to-talk configurations, are tested for SAR compliance with the front of the device positioned to face the flat phantom in head fluid.

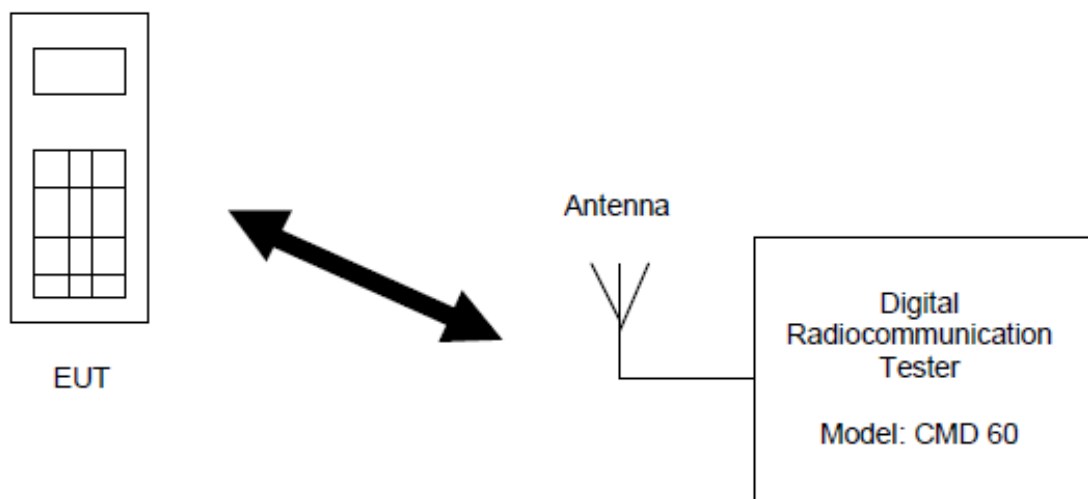

## TEST REPORT

### 6.3. General Device Setup

The device was first charged on a charger over a duration defined by the applicant to make sure the installed battery was fully charged.

The device was then placed into TBR6 test mode to simulate the worst case voice call configuration through the middle channel, where the operating parameters established in this TBR6 test mode is identical to those programmed in production units, including output power levels, amplifier gain settings and other RF performance tuning parameters. The test frequency is corresponded to actual channel frequencies defined for domestic use.

During testing, the device was evaluated with a fully charged battery, power saving function disabled and was configured to operate at maximum output power. A receive antenna and a base station simulator – Digital Radiocommunication Tester, model: CMD60 were placed with a distance > 50cm away from the device to established the voice call communication and monitor the transmission states.

## TEST REPORT

### 6.4. RF Output Power Measurements

| Frequency       | Channel    | Duty Cycle | Maximum<br>tune-up power<br>(dBm) | Measured<br>Conducted Power<br>(Peak)<br>(dBm) | Measured<br>Conducted Power<br>(Time average)<br>(dBm) |
|-----------------|------------|------------|-----------------------------------|--|--|
| 1.9 GHz<br>DECT | High – 0   | 1/24       | 20.4                              | 18.80  | 5.00   |
|                 | Middle – 2 |            | 20.4                              | 18.80  | 5.00   |
|                 | Low - 4    |            | 20.4                              | 18.70  | 4.90   |

Note:

1. Time Average power (dBm) = Peak power (dBm) + Time Average factor.
2. Time Average factor =  $10 \cdot \log(\text{duty cycle})$
3. Per KDB 447498 D01, the tested device was within the specified tune-up tolerances range, but not more than 2dB lower than the maximum tune-up tolerance limit.
4. Per KDB 447498 D01, when antenna port was not available on the device to support conducted power measurement and test software was used to establish transmitter power levels, the power level was verified separately according to design and component specifications and product development information specified by the manufacturer.

## TEST REPORT

### 6.5. Exposure Conditions

#### In-Front-of Face Exposure Conditions

| Test Configurations | Distance to phantom | Operation Mode | SAR Required | Note                                    |
|---------------------|---------------------|----------------|--------------|---|
| Front               | 25 mm               | Voice          | Yes          | 2.4V 1300mAh Ni-MH rechargeable battery |

Note:

1. The device supports push-to-talk transmission for In-Front-of face exposure configuration.
2. Per KDB 447498 D01, a test separation of 25 mm must be applied for in-front-of the face SAR measurement.

#### Body Exposure Conditions

| Test Configurations | Distance to phantom | Operation Mode | SAR Required | Note                                    |
|---------------------|---------------------|----------------|--------------|---|
| Front               | 0 mm                | Voice          | Yes          | 2.4V 1300mAh Ni-MH rechargeable battery |
| Rear                | 0 mm                | Voice          | Yes          | 2.4V 1300mAh Ni-MH rechargeable battery |
| Left                | 0 mm                | Voice          | Yes          | 2.4V 1300mAh Ni-MH rechargeable battery |
| Right               | 0 mm                | Voice          | Yes          | 2.4V 1300mAh Ni-MH rechargeable battery |
| Top                 | 0 mm                | Voice          | Yes          | 2.4V 1300mAh Ni-MH rechargeable battery |
| Bottom              | 0 mm                | Voice          | Yes          | 2.4V 1300mAh Ni-MH rechargeable battery |

## TEST REPORT

### 6.6. Test Result

The results on the following page(s) were obtained when the device was tested in the condition described in this report. Detailed measurement data and plots, which reveal information about the location of the maximum SAR with respect to the device, are reported in Appendix B.

#### In-Front-of Face SAR

| Measurement Result |                |         |       |                  |                                      |                            |                     |   |                   |   |      |

Note:

1. Fully charged batteries were used at the beginning of each SAR measurement.
2. There was no power reduction used for any band / mode implemented in this device.
3. Reported SAR results were scaled to the maximum allowed power with the scaling factor equation  $-10^{[(\text{Maximum power} - \text{measured power}) / 10]}$ .
4. Per KDB 447498 D01, when the maximum output power variation across the required test channels was < 0.5dB, measurement on middle channel was required.
5. Per KDB 447498 D01, if the reported SAR value was  $\leq 0.8$  W/kg and the transmission band was  $\leq 100$ MHz, SAR testing was not required for the other test channels in the band.
6. Per KDB 865664 D01, repeated measurement was not required when the original highest measured SAR was < 0.8W/kg.
7. Per KDB 865664 D02, SAR plot is required for the highest measured SAR in each exposure configuration, wireless mode and frequency band combination.

## TEST REPORT

#### Note:

- Fully charged batteries were used at the beginning of each SAR measurement.
- There was no power reduction used for any band / mode implemented in this device.
- Reported SAR results were scaled to the maximum allowed power with the scaling factor equation  $-10^{[(\text{Maximum power} - \text{measured power}) / 10]}$ .
- Per KDB 447498 D01, when the maximum output power variation across the required test channels was < 0.5dB, measurement on middle channel was required.
- Per KDB 447498 D01, if the reported SAR value was  $\leq 0.8$  W/kg and the transmission band was  $\leq 100$ MHz, SAR testing was not required for the other test channels in the band.
- Per KDB 865664 D01, repeated measurement was not required when the original highest measured SAR was < 0.8W/kg.
- Per KDB 865664 D02, SAR plot is required for the highest measured SAR in each exposure configuration, wireless mode and frequency band combination.

## TEST REPORT

### 6.7. SAR Limits

The following FCC limits (Std. C95.1-1992) for SAR apply to devices operate in General Population/Uncontrolled Exposure and Controlled environment:

#### GENERAL POPULATION / UNCONTROLLED ENVIRONMENTS:

Defined as location where there is the exposure of individuals who have no knowledge or control of their exposure.

| EXPOSURE<br>(General Population/Uncontrolled Exposure environment) | SAR<br>(W/kg) |
|--|---------------|
| Spatial Peak SAR (Head)*   | 1.60          |
| Spatial Peak SAR (Partial Body)*                                   | 1.60          |
| Spatial Peak SAR (Whole Body)*                                     | 0.08          |
| Spatial Peak SAR (Hands / Wrists / Feet / Ankles)**                | 4.00          |

#### OCCUPATIONAL / CONTROLLED ENVIRONMENTS:

Defined as location where there is the exposure that may be incurred by persons who are aware of the potential for exposure, (i.e. as a result of employment or occupation)

| EXPOSURE<br>(Occupational/Controlled Exposure environment) | SAR<br>(W/kg) |
|--|---------------|
| Spatial Peak SAR (Head)*                                   | 8.00          |
| Spatial Peak SAR (Partial Body)*                           | 8.00          |
| Spatial Peak SAR (Whole Body)*                             | 0.40          |
| Spatial Peak SAR (Hands / Wrists / Feet / Ankles)**        | 20.00         |

#### Notes:

\* The Spatial Peak value of the SAR averaged over any 1 gram of tissue.  
(defined as a tissue volume in the shape of a cube) and over the appropriate averaging time

\*\* The Spatial Peak value of the SAR averaged over any 10 gram of tissue.  
(defined as a tissue volume in the shape of a cube) and over the appropriate averaging time

## TEST REPORT

### 9. E-FIELD PROBE AND DIPOLE ANTENNA CALIBRATION

Probe calibration factors and dipole antenna calibration are included in Appendix C.

## TEST REPORT

### APPENDIX A – SYSTEM CHECK DATA

#### System Check\_H1900

##### DUT: Dipole 1900 MHz D1900V2

Communication System: UID 0, CW (0); Frequency: 1900 MHz; Duty Cycle: 1:1

Medium: HSL1900 Medium parameters used:  $f = 1900$  MHz;  $\sigma = 1.393$  S/m;  $\epsilon_r = 39.493$ ;  $\rho = 1000$  kg/m<sup>3</sup>

##### DASY5 Configuration:

- Probe: ES3DV3 - SN3240; ConvF(5.13, 5.13, 5.13); Calibrated: 3/28/2018;
- Sensor-Surface: 3mm (Mechanical Surface Detection)
- Electronics: DAE4 Sn420; Calibrated: 3/22/2018
- Phantom: SAM 1; Type: QD000P40CC; Serial: TP:1469
- Measurement SW: DASY52, Version 52.8 (8); SEMCAD X Version 14.6.10 (7373)

**Configuration/Configuration/Area Scan (61x61x1):** Interpolated grid: dx=1.500 mm, dy=1.500 mm

Maximum value of SAR (interpolated) = 3.92 W/kg

**Configuration/Configuration/Zoom Scan (5x5x7)/Cube 0:** Measurement grid: dx=8mm, dy=8mm, dz=5mm

Reference Value = 52.77 V/m; Power Drift = 0.08 dB

Peak SAR (extrapolated) = 5.61 W/kg

SAR(1 g) = 3.83 W/kg; SAR(10 g) = 2.11 W/kg

Maximum value of SAR (measured) = 3.92 W/kg

## TEST REPORT

### APPENDIX A – SYSTEM CHECK DATA (CONT'D)

#### System Check\_B1900

**DUT: Dipole 1900 MHz D1900V2**

Communication System: UID 0, CW (0); Frequency: 1900 MHz; Duty Cycle: 1:1

Medium: MSL1900 Medium parameters used:  $f = 1900$  MHz;  $\sigma = 1.554$  S/m;  $\epsilon_r = 54.479$ ;  $\rho = 1000$  kg/m<sup>3</sup>

DASY5 Configuration:

- Probe: ES3DV3 - SN3240; ConvF(4.8, 4.8, 4.8); Calibrated: 3/28/2018;
- Sensor-Surface: 3mm (Mechanical Surface Detection)
- Electronics: DAE4 Sn420; Calibrated: 3/22/2018
- Phantom: SAM 1; Type: QD000P40CC; Serial: TP:1469
- Measurement SW: DASY52, Version 52.8 (8); SEMCAD X Version 14.6.10 (7373)

**Configuration/Configuration/Area Scan (61x61x1):** Interpolated grid: dx=1.500 mm, dy=1.500 mm

Maximum value of SAR (interpolated) = 4.65 W/kg

**Configuration/Configuration/Zoom Scan (5x5x7)/Cube 0:** Measurement grid: dx=8mm, dy=8mm, dz=5mm

Reference Value = 54.56 V/m; Power Drift = 0.08 dB

Peak SAR (extrapolated) = 6.59 W/kg

SAR(1 g) = 3.66 W/kg; SAR(10 g) = 1.9 W/kg

Maximum value of SAR (measured) = 4.65 W/kg

## TEST REPORT

### APPENDIX B – SAR EVALUATION DATA

Communication System: UID 0, DECT (0); Frequency: 1924.99 MHz; Duty Cycle: 1:24

Medium: HSL1900 Medium parameters used (extrapolated):  $f = 1924.99$  MHz;  $\sigma = 1.412$  S/m;  $\epsilon_r = 39.479$ ;  $\rho = 1000$  kg/m<sup>3</sup>

DASY5 Configuration:

- Probe: ES3DV3 - SN3240; ConvF(5.13, 5.13, 5.13); Calibrated: 3/28/2018;
- Sensor-Surface: 3mm (Mechanical Surface Detection)
- Electronics: DAE4 Sn420; Calibrated: 3/22/2018
- Phantom: SAM 1; Type: QD000P40CC; Serial: TP:1469
- Measurement SW: DASY52, Version 52.8 (8); SEMCAD X Version 14.6.10 (7373)

**Configuration/Test/Area Scan (71x111x1):** Interpolated grid:  $dx=1.500$  mm,  $dy=1.500$  mm  
Maximum value of SAR (interpolated) = 0.00798 W/kg

**Configuration/Test/Zoom Scan (5x5x7)/Cube 0:** Measurement grid:  $dx=8$ mm,  $dy=8$ mm,  $dz=5$ mm

Reference Value = 1.054 V/m; Power Drift = -0.05 dB

Peak SAR (extrapolated) = 0.0110 W/kg

SAR(1 g) = 0.00576 W/kg; SAR(10 g) = 0.00327 W/kg

Maximum value of SAR (measured) = 0.00688 W/kg

## TEST REPORT

### APPENDIX B – SAR EVALUATION DATA (CONT'D)

Communication System: UID 0, DECT (0); Frequency: 1924.99 MHz; Duty Cycle: 1:24

Medium: MSL1900 Medium parameters used (extrapolated):  $f = 1924.99$  MHz;  $\sigma = 1.582$  S/m;  $\epsilon_r = 54.405$ ;  $\rho = 1000$  kg/m<sup>3</sup>

DASY5 Configuration:

- Probe: ES3DV3 - SN3240; ConvF(4.8, 4.8, 4.8); Calibrated: 3/28/2018;
- Sensor-Surface: 3mm (Mechanical Surface Detection)
- Electronics: DAE4 Sn420; Calibrated: 3/22/2018
- Phantom: SAM 1; Type: QD000P40CC; Serial: TP:1469
- Measurement SW: DASY52, Version 52.8 (8); SEMCAD X Version 14.6.10 (7373)

**Configuration/Test/Area Scan (71x61x1):** Interpolated grid:  $dx=1.500$  mm,  $dy=1.500$  mm  
Maximum value of SAR (interpolated) = 0.0310 W/kg

**Configuration/Test/Zoom Scan (5x5x7)/Cube 0:** Measurement grid:  $dx=8$ mm,  $dy=8$ mm,  $dz=5$ mm

Reference Value = 2.225 V/m; Power Drift = 0.08 dB

Peak SAR (extrapolated) = 0.0400 W/kg

SAR(1 g) = 0.024 W/kg; SAR(10 g) = 0.015 W/kg

Maximum value of SAR (measured) = 0.0287 W/kg

## CALIBRATION CERTIFICATE

Object ES3DV3 - SN:3240

Calibration Procedure(s) FF-Z11-004-01  
Calibration Procedures for Dosimetric E-field Probes

Calibration date: March 28, 2018

This calibration Certificate documents the traceability to national standards, which realize the physical units of measurements(SI). The measurements and the uncertainties with confidence probability are given on the following pages and are part of the certificate.

All calibrations have been conducted in the closed laboratory facility: environment temperature(22±3)°C and humidity<70%.

Calibration Equipment used (M&TE critical for calibration)

| Primary Standards       | ID #        | Cal Date(Calibrated by, Certificate No.) | Scheduled Calibration |
|-------------------------|-------------|--|-----------------------|
| Power Meter NRP2        | 101919      | 27-Jun-17 (CTTL, No.J17X05857)           | Jun-18                |

## Glossary:

|                       |   |
|-----------------------|---|
| TSL                   | tissue simulating liquid  |
| NORM <sub>x,y,z</sub> | sensitivity in free space   |
| ConvF                 | sensitivity in TSL / NORM <sub>x,y,z</sub>  |
| DCP                   | diode compression point   |
| CF                    | crest factor (1/duty_cycle) of the RF signal  |
| A,B,C,D               | modulation dependent linearization parameters   |
| Polarization $\Phi$   | $\Phi$ rotation around probe axis   |
| Polarization $\theta$ | $\theta$ rotation around an axis that is in the plane normal to probe axis (at measurement center), i<br>$\theta=0$ is normal to probe axis |

Connector Angle information used in DASY system to align probe sensor X to the robot coordinate system

## Calibration is Performed According to the Following Standards:

- IEEE Std 1528-2013, "IEEE Recommended Practice for Determining the Peak Spatial-Averaged Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques", June 2013
- IEC 62209-1, "Measurement procedure for the assessment of Specific Absorption Rate (SAR) from hand-held and body-mounted devices used next to the ear (frequency range of 300 MHz to 6 GHz)", July 2016
- IEC 62209-2, "Procedure to determine the Specific Absorption Rate (SAR) for wireless communication devices used in close proximity to the human body (frequency range of 30 MHz to 6 GHz)", March 2010
- KDB 865664, "SAR Measurement Requirements for 100 MHz to 6 GHz"

## Methods Applied and Interpretation of Parameters:

- NORM<sub>x,y,z</sub>**: Assessed for E-field polarization  $\theta=0$  ( $f \leq 900\text{MHz}$  in TEM-cell;  $f > 1800\text{MHz}$ : waveguide). NORM<sub>x,y,z</sub> are only intermediate values, i.e., the uncertainties of NORM<sub>x,y,z</sub> does not effect the  $E^2$ -field uncertainty inside TSL (see below ConvF).
- NORM(f)<sub>x,y,z</sub>** = NORM<sub>x,y,z</sub> \* frequency\_response (see Frequency Response Chart). This linearization is implemented in DASY4 software versions later than 4.2. The uncertainty of the frequency response is included in the stated uncertainty of ConvF.
- DCP<sub>x,y,z</sub>**: DCP are numerical linearization parameters assessed based on the data of power sweep (no uncertainty required). DCP does not depend on frequency nor media.
- PAR**: PAR is the Peak to Average Ratio that is not calibrated but determined based on the signal characteristics.
- A<sub>x,y,z</sub>; B<sub>x,y,z</sub>; C<sub>x,y,z</sub>; VR<sub>x,y,z</sub>; A,B,C** are numerical linearization parameters assessed based on the data of power sweep for specific modulation signal. The parameters do not depend on frequency nor media. VR is the maximum calibration range expressed in RMS voltage across the diode.
- ConvF and Boundary Effect Parameters**: Assessed in flat phantom using E-field (or Temperature Transfer Standard for  $f \leq 800\text{MHz}$ ) and inside waveguide using analytical field distributions based on power measurements for  $f > 800\text{MHz}$ . The same setups are used for assessment of the parameters applied for boundary compensation (alpha, depth) of which typical uncertainty valued are given. These parameters are used in DASY4 software to improve probe accuracy close to the boundary. The sensitivity in TSL corresponds to NORM<sub>x,y,z</sub> \* ConvF whereby the uncertainty corresponds to that given for ConvF. A frequency dependent ConvF is used in DASY version 4.4 and higher which allows extending the validity from  $\pm 50\text{MHz}$  to  $\pm 100\text{MHz}$ .
- Spherical isotropy (3D deviation from isotropy)**: in a field of low gradients realized using a flat phantom exposed by a patch antenna.
- Sensor Offset**: The sensor offset corresponds to the offset of virtual measurement center from the probe tip (on probe axis). No tolerance required.
- Connector Angle**: The angle is assessed using the information gained by determining the NORM<sub>x</sub> (no uncertainty required).

# Probe ES3DV3

## SN: 3240

Calibrated: March 28, 2018

Calibrated for DASY/EASY Systems

(Note: non-compatible with DASY2 system!)

## DASY/EASY – Parameters of Probe: ES3DV3 - SN: 3240

### Basic Calibration Parameters

|  | Sensor X | Sensor Y | Sensor Z | Unc (k=2)    |
|--|----------|----------|----------|--------------|
| Norm( $\mu\text{V}/(\text{V}/\text{m})^2$ ) <sup>A</sup> | 1.23     | 1.24     | 1.11     | $\pm 10.0\%$ |
| DCP(mV) <sup>B</sup>                                     | 105.7    | 105.1    | 103.3    |              |

### Modulation Calibration Parameters

| UID | Communication System Name |   | A<br>dB | B<br>dB $\sqrt{\mu\text{V}}$ | C   | D<br>dB | VR<br>mV | Unc <sup>E</sup><br>(k=2) |
|-----|---------------------------|---|---------|------------------------------|-----|---------|----------|---------------------------|
| 0   | CW                        | X | 0.0     | 0.0                          | 1.0 | 0.00    | 277.5    | $\pm 2.2\%$               |
|     |                           | Y | 0.0     | 0.0                          | 1.0 |         | 274.4    |                           |
|     |                           | Z | 0.0     | 0.0                          | 1.0 |         | 254.7    |                           |

The reported uncertainty of measurement is stated as the standard uncertainty of Measurement multiplied by the coverage factor  $k=2$ , which for a normal distribution Corresponds to a coverage probability of approximately 95%.

<sup>A</sup> The uncertainties of Norm X, Y, Z do not affect the  $E^2$ -field uncertainty inside TSL (see Page 5 and Page 6).

<sup>B</sup> Numerical linearization parameter: uncertainty not required.

<sup>E</sup> Uncertainty is determined using the max. deviation from linear response applying rectangular distribution and is expressed for the square of the field value.

| 1900                 | 40.0                               | 1.40                            | 5.13    | 5.13    | 5.13    | 0.63               | 1.26                    | ± 12.1%     |
| 2300                 | 39.5                               | 1.67                            | 5.06    | 5.06    | 5.06    | 0.90               | 1.09                    | ± 12.1%     |
| 2450                 | 39.2                               | 1.80                            | 4.74    | 4.74    | 4.74    | 0.88               | 1.16                    | ± 12.1%     |
| 2600                 | 39.0                               | 1.96                            | 4.63    | 4.63    | 4.63    | 0.90               | 1.12                    | ± 12.1%     |

<sup>C</sup> Frequency validity above 300 MHz of ±100MHz only applies for DASY v4.4 and higher (Page 2), else it is restricted to ±50MHz. The uncertainty is the RSS of ConvF uncertainty at calibration frequency and the uncertainty for the indicated frequency band. Frequency validity below 300 MHz is ± 10, 25, 40, 50 and 70 MHz for ConvF assessments at 30, 64, 128, 150 and 220 MHz respectively. Above 5 GHz frequency validity can be extended to ± 110 MHz.

<sup>F</sup> At frequency below 3 GHz, the validity of tissue parameters ( $\epsilon$  and  $\sigma$ ) can be relaxed to ±10% if liquid compensation formula is applied to measured SAR values. At frequencies above 3 GHz, the validity of tissue parameters ( $\epsilon$  and  $\sigma$ ) is restricted to ±5%. The uncertainty is the RSS of the ConvF uncertainty for indicated target tissue parameters.

<sup>G</sup> Alpha/Depth are determined during calibration. SPEAG warrants that the remaining deviation due to the boundary effect after compensation is always less than ± 1% for frequencies below 3 GHz and below ± 2% for the frequencies between 3-6 GHz at any distance larger than half the probe tip diameter from the boundary.

## CALIBRATION CERTIFICATE

Object **D1900V2 - SN:5d018**

Calibration procedure(s) **QA CAL-05.v10  
Calibration procedure for dipole validation kits above 700 MHz**

Calibration date: **June 21, 2018**

This calibration certificate documents the traceability to national standards, which realize the physical units of measurements (SI).  
The measurements and the uncertainties with confidence probability are given on the following pages and are part of the certificate.

All calibrations have been conducted in the closed laboratory facility: environment temperature  $(22 \pm 3)^\circ\text{C}$  and humidity < 70%.

Calibration Equipment used (M&TE critical for calibration)

Accreditation No.: **SCS 0108**

### Glossary:

|       |                                 |
|-------|---------------------------------|
| TSL   | tissue simulating liquid        |
| ConvF | sensitivity in TSL / NORM x,y,z |
| N/A   | not applicable or not measured  |

### Calibration is Performed According to the Following Standards:

- IEEE Std 1528-2013, "IEEE Recommended Practice for Determining the Peak Spatial-Averaged Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques", June 2013
- IEC 62209-1, "Measurement procedure for the assessment of Specific Absorption Rate (SAR) from hand-held and body-mounted devices used next to the ear (frequency range of 300 MHz to 6 GHz)", July 2016
- IEC 62209-2, "Procedure to determine the Specific Absorption Rate (SAR) for wireless communication devices used in close proximity to the human body (frequency range of 30 MHz to 6 GHz)", March 2010
- KDB 865664, "SAR Measurement Requirements for 100 MHz to 6 GHz"

### Additional Documentation:

- DASY4/5 System Handbook

### Methods Applied and Interpretation of Parameters:

- Measurement Conditions:** Further details are available from the Validation Report at the end of the certificate. All figures stated in the certificate are valid at the frequency indicated.
- Antenna Parameters with TSL:** The dipole is mounted with the spacer to position its feed point exactly below the center marking of the flat phantom section, with the arms oriented parallel to the body axis.
- Feed Point Impedance and Return Loss:** These parameters are measured with the dipole positioned under the liquid filled phantom. The impedance stated is transformed from the measurement at the SMA connector to the feed point. The Return Loss ensures low reflected power. No uncertainty required.
- Electrical Delay:** One-way delay between the SMA connector and the antenna feed point. No uncertainty required.
- SAR measured:** SAR measured at the stated antenna input power.
- SAR normalized:** SAR as measured, normalized to an input power of 1 W at the antenna connector.
- SAR for nominal TSL parameters:** The measured TSL parameters are used to calculate the nominal SAR result.

The reported uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor  $k=2$ , which for a normal distribution corresponds to a coverage probability of approximately 95%.

## Measurement Conditions

DASY system configuration, as far as not given on page 1.

|                              |                        |             |

## SAR result with Head TSL

|   |                    |  |
|---|--------------------|--|
| SAR averaged over 1 cm <sup>3</sup> (1 g) of Head TSL | Condition          |  |
| SAR measured  | 250 mW input power | 9.77 W/kg                                      |
| SAR for nominal Head TSL parameters                   | normalized to 1W   | <b>40.1 W/kg <math>\pm</math> 17.0 % (k=2)</b> |

|   |                    |  |
|---|--------------------|--|
| SAR averaged over 10 cm <sup>3</sup> (10 g) of Head TSL | condition          |  |
| SAR measured  | 250 mW input power | 5.22 W/kg                                      |
| SAR for nominal Head TSL parameters                     | normalized to 1W   | <b>21.2 W/kg <math>\pm</math> 16.5 % (k=2)</b> |

## Body TSL parameters

The following parameters and calculations were applied.

|   | Temperature         | Permittivity   | Conductivity         |
|---|---------------------|----------------|----------------------|
| Nominal Body TSL parameters             | 22.0 °C             | 53.3           | 1.52 mho/m           |
| Measured Body TSL parameters            | (22.0 $\pm$ 0.2) °C | 54.9 $\pm$ 6 % | 1.46 mho/m $\pm$ 6 % |
| Body TSL temperature change during test | < 0.5 °C            | ----           | ----                 |

## SAR result with Body TSL

|   |                    |  |
|---|--------------------|--|
| SAR averaged over 1 cm <sup>3</sup> (1 g) of Body TSL | Condition          |  |
| SAR measured  | 250 mW input power | 9.75 W/kg                                      |
| SAR for nominal Body TSL parameters                   | normalized to 1W   | <b>40.2 W/kg <math>\pm</math> 17.0 % (k=2)</b> |

|   |                    |  |
|---|--------------------|--|
| SAR averaged over 10 cm <sup>3</sup> (10 g) of Body TSL | condition          |  |
| SAR measured  | 250 mW input power | 5.24 W/kg                                      |
| SAR for nominal Body TSL parameters                     | normalized to 1W   | <b>21.4 W/kg <math>\pm</math> 16.5 % (k=2)</b> |

## Appendix (Additional assessments outside the scope of SCS 0108)

### Antenna Parameters with Head TSL

|                                      |                             |
|--------------------------------------|-----------------------------|
| Impedance, transformed to feed point | $52.2 \Omega + 1.6 j\Omega$ |
| Return Loss                          | - 31.4 dB                   |

### Antenna Parameters with Body TSL

|                                      |                             |
|--------------------------------------|-----------------------------|
| Impedance, transformed to feed point | $47.1 \Omega + 3.0 j\Omega$ |
| Return Loss                          | - 27.3 dB                   |

### General Antenna Parameters and Design

|                                  |          |
|----------------------------------|----------|
| Electrical Delay (one direction) | 1.195 ns |
|----------------------------------|----------|

After long term use with 100W radiated power, only a slight warming of the dipole near the feedpoint can be measured.

The dipole is made of standard semirigid coaxial cable. The center conductor of the feeding line is directly connected to the second arm of the dipole. The antenna is therefore short-circuited for DC-signals. On some of the dipoles, small end caps are added to the dipole arms in order to improve matching when loaded according to the position as explained in the "Measurement Conditions" paragraph. The SAR data are not affected by this change. The overall dipole length is still according to the Standard.

No excessive force must be applied to the dipole arms, because they might bend or the soldered connections near the feedpoint may be damaged.

### Additional EUT Data

## DASY5 Validation Report for Head TSL

Date: 21.06.2018

Test Laboratory: SPEAG, Zurich, Switzerland

**DUT: Dipole 1900 MHz; Type: D1900V2; Serial: D1900V2 - SN:5d018**

Communication System: UID 0 - CW; Frequency: 1900 MHz

Medium parameters used:  $f = 1900$  MHz;  $\sigma = 1.35$  S/m;  $\epsilon_r = 40.6$ ;  $\rho = 1000$  kg/m<sup>3</sup>

Phantom section: Flat Section

Measurement Standard: DASY5 (IEEE/IEC/ANSI C63.19-2011)

DASY52 Configuration:

- Probe: EX3DV4 - SN7349; ConvF(8.18, 8.18, 8.18) @ 1900 MHz; Calibrated: 30.12.2017
- Sensor-Surface: 1.4mm (Mechanical Surface Detection)
- Electronics: DAE4 Sn601; Calibrated: 26.10.2017
- Phantom: Flat Phantom 5.0 (front); Type: QD 000 P50 AA; Serial: 1001
- DASY52 52.10.1(1476); SEMCAD X 14.6.11(7439)

### **Dipole Calibration for Head Tissue/Pin=250 mW, d=10mm/Zoom Scan (7x7x7)/Cube 0:**

Measurement grid: dx=5mm, dy=5mm, dz=5mm

Reference Value = 109.9 V/m; Power Drift = -0.04 dB

Peak SAR (extrapolated) = 17.6 W/kg

**SAR(1 g) = 9.77 W/kg; SAR(10 g) = 5.22 W/kg**

Maximum value of SAR (measured) = 14.9 W/kg

0 dB = 14.9 W/kg = 11.73 dBW/kg
